SE – Introduction to Web Technologies – HTML and CSS

Session – 6

1. **Create an HTML file that displays a Zomato-style restaurant card with a restaurant name, cuisine type, and rating. Use CSS to add margin, padding, and a visible border to the card so that each section is clearly separated.**

Ans : -

restaurant.html :

```
<!DOCTYPE html>
<html>
<head>
    <title>Zomato Restaurant Card</title>
    <style>
        .card{
            width:300px;
            border:2px solid gray;
            margin:20px;
            padding:15px;
        }

        .section{
            border-bottom:1px solid lightgray;
            margin:10px 0;
            padding:10px 0;
        }
    </style>
</head>
<body>

<div class="card">

    <div class="section">
        <h2>Spice Garden</h2>
    </div>

    <div class="section">
        <p>Cuisine: North Indian</p>
    </div>

    <div class="section">
        <p>⭐ Rating: 4.5/5</p>
    </div>

</div>
```

```
</body>
</html>
```

2. **Design a Flipkart-style product tile with an image, product name, and price. Use different display properties (block, inline-block, none) to control the layout of the product name and price, and hide the price when a specific CSS class is added.

Hint: Try toggling the class in your HTML to see the effect.**

Ans : -

product.html :

```
<!DOCTYPE html>
<html>
<head>
    <title>Flipkart Product</title>

    <style>

        .product{
            width:250px;
            border:1px solid #ccc;
            padding:15px;
        }

        img{
            width:100%;
            display:block;
        }

        .name{
            display:block;
            font-size:20px;
            margin-top:10px;
        }

        .price{
            display:inline-block;
            color:green;
            font-weight:bold;
        }

        .hide-price{
            display:none;
        }

    </style>
```

```
</head>
<body>

<div class="product">

    <img src="phone.jpg" alt="Phone">

    <span class="name">Samsung Galaxy S25</span>

    <span class="price">₹74,999</span>

    <!-- To hide the price, change the line above to:
    <span class="price hide-price">₹74,999</span>
    -->

</div>

</body>
</html>
```

3. **Build a fixed-position WhatsApp chat notification badge at the bottom right corner of the screen. Use position: fixed and appropriate margin and padding to ensure it stays visible even when scrolling.**

Ans :

```
<!DOCTYPE html>
<html>
<head>
    <title>WhatsApp Badge</title>

    <style>

        .badge{
            position:fixed;
            bottom:20px;
            right:20px;
            background:green;
            color:white;
            padding:15px;
            border-radius:50%;
            font-size:20px;
        }

    </style>

</head>
```

```
<body>

<p>Scroll the page to see the fixed badge.</p>

<div style="height:1500px;"></div>

<div class="badge">
    💬
</div>

</body>
</html>
```

4. **Create a BookMyShow movie poster grid where each poster uses position: relative. Add a 'New' badge to the top-left corner of one poster using position: absolute, so it overlays the image correctly.

Hint: Use top and left properties with position: absolute inside a relatively positioned parent.**

Ans : -

```
<!DOCTYPE html>
<html>
<head>
    <title>Movie Posters</title>

    <style>

        .poster{
            position:relative;
            display:inline-block;
            margin:20px;
        }

        .poster img{
            width:200px;
            height:300px;
        }

        .badge{
            position:absolute;
            top:10px;
            left:10px;
            background:red;
            color:white;
            padding:5px 10px;
            border-radius:5px;
        }
```

```
    </style>

</head>
<body>

<div class="poster">

    <span class="badge">New</span>

    <img src="movie.jpg" alt="Movie Poster">

</div>

<div class="poster">
    <img src="movie2.jpg" alt="Movie Poster">
</div>

</body>
</html>
```

5. **Refactor your CSS for any one of the above tasks to reduce repeated margin and padding values by using a reusable CSS class. Explain in a comment how this improves maintainability.**

Ans : -

```
<!DOCTYPE html>
<html>
<head>
    <title>Reusable CSS Class</title>

    <style>

        /* This reusable class reduces repeated margin and padding,
           making the CSS easier to maintain and update. */

        .spacing{
            margin:15px;
            padding:15px;
        }

        .card{
            border:1px solid gray;
        }

    </style>

</head>
```

```
<body>

<div class="card spacing">
    Restaurant Card
</div>

<div class="card spacing">
    Product Card
</div>

</body>
</html>
```
